

# IDEAS

## Flood Risk by state

Flood Risk (moderate)

Flow Diagram (Flood causes → incident → damage)

## Spider Chart

(Each color represents a state)

## Filter

Flood Risk by State

Spider Chart

## CATEGORIZE

Flood Risk by State

Spider Chart

## Combine and Refine

All current visualisation are distinct from each other, no combination can be done

## Questions

- 1) Is the proposed visualisation doable?
- 2) Do they provide value to readers who are interested in said topic
- 3) Does this answer the topic question?

Layout

Title

Sheet 2

Name: Bryan Neoh Zheng Hong

Date: 01/10/25

Title: Malaysia Flood Risk  
Analysis

Task: Create draft on how  
the dashboard would  
look like

Intro text

blablabla bla

Flood Risk by State

Flood Risk

Explain Flood Risk metric and  
normalization  
Give a general summary of  
results  
Tie to real world events

Focus

No main focus, each visualization plays  
an equally important role in telling  
the full story

Flood Trend Over time

Explain graph

Give summary,

Add annotations onto graph to explain  
results using real world events

Discussion

- This dashboard feels lackluster,  
lacks complexity
- A coherent storyline seems to be  
absent

Economic Damage over time (by flood)

Explain graph

Give summary

Add annotations onto graph to explain  
results using real world events

Summarize findings and come to a conclusion

Operations

None as of now, but an interactive slider can be integrated for [Flood Risk by State]

Layout

Title

Name: Bryan Nesh Zheng Hong

Date: 01/10/25

Title: Malaysia Flood Risk Analysis

Task: Create an alternate idea of the dashboard based on visuals of sheet 1

Intro text

Shows the individual factor leading up to floods for each state

Give a general summary based on results

Operations

2014

An interactive slide can be added to show which year to view, increasing comprehensiveness

Focus

Main focus of this draft is the Spider chart, as it is the most complex, the other visuals act as supporting elements

Discussion

- Spider chart may not be feasible, due to the number of states, making the chart illegible
- Too much reliance on one single chart

Flood Risk Ranking by State

Explain graph

Give summary

(No annotations can be added)

Economic Damage over Time

Explain Graph

Give summary

All Annotations into graphs to explain results using real world events

Summarize findings and come to a conclusion

Name: Bryan Neoh Zheng Hoog

Date: 01/10/25

Title: Malaysia Flood Risk Analysis

Task: Implement (improved ideas) from previous sheets

Intro text

Blah Blah Blah

### Flood Risk by State (by year)

Flood Risk

Same as the idea in sheet 2, however implemented with the interactive year slider from sheet 3, other than that, it's the same

### Focus

No main focus, each visualization plays an equally important role in telling the full story

2014

Relationship between Heavy Rainfall and Flood incidents

Penang  
Selangor  
Kelantan

Scatter Plot showing the relationship between heavy rainfall and flood incidents

Give summary

Add annotations to each point with details such as the specific numbers.

### Discussion

- Scatter plot could use for functionality (maybe a sizing change for damage?)
- Others seem fine

### Flood Risk Ranking by State

Identical to Sheet 3's visualization

Summarise Findings and come to a conclusion

### Operational

An interactive slider that allows the viewer to choose which year to view.

Date: 01/10/25

Title: Malaysia Flood Risk Analysis

Task: Draft of the final visualization to be implemented

Tr

Title

Intro text, explaining scenario and problem statement

Flood Risk by State (by Year)

Give summary of graph

Malaysia Flood Risk over time

Give summary of graph

Flood incidents vs Economic Dmg over time

Give summary of graph

Relationship between flood incidents and heavy rain

Give summary of graph

Conclusion and key Take away

Data Sources and methodology

Metadata

Background

Background

Focus

No main focus, all visuals are equally important

Details

- Vega Lite to illustrate the visuals, and GitHub pages to present it in an HTML format
- R used for cleaning and aggregating data
- Estimate Time of completion: 7 days: 3 for the map, 1 for each of the visual, 1 day for finalizing the visualization

Operations
